

Accessories

Glova is a **European vacuum toilet system** manufacturer and an important key player in the rail industry, offering engineering and consultancy for toilet refurbishment and overhaul. In order to ensure a stable and reliable service of the toilet systems, Glova is manufacturing a range of accessories for testing and avoiding scale build up.

Support

Solving problems

At Glova we not only manufacture our own brand of toilet systems and spare parts but for major toilet systems on the market. We also have a range of accessories and parts which each solve problems. Very old coaches might not have service air onboard and to solve this issue, Glova has made a small compressor unit.

Another more modern issue is the wish to reuse the grey water as flushing water. Glova has a special information display with four pictures which is visible and for water saving frost system we have a thermostatic operated dumper valve.

● Information display

● Grey water unit

● Pipe descaling rig

● Testing rig

Two major items are also solving big problems. The Glova pipe cleaning rig help keeping the calcium build up under control and thereby increasing the toilet system reliability.

The Glova Test Table on the other hand directly test and monitor the toilet module performance and insure that a toilet module not only just live up to the demands but that the performance are good enough to ensure a service life until the next service overhaul is due.

With expenses for handling, sterilizing and cleaning the toilet module often being the major part of the cost it is extremely important that the modules are performance tested and that it is documented that they are fit for a long period in service once they are going to be reinstalled.
